A Textbook of
ENGINEERING PHYSICS PRACTICAL
2nd Edition

ABOUT THE BOOK
“A Textbook of Engineering Physics Practical” is a collection of thirty-four experiments focused on the most urgent issues arising from the need of quality education in engineering labs today and in the near future. Written by experienced teachers and researchers, the book is divided into three units: General Physics Lab, Optics Lab & Modern Physics Lab. This book will prove to be a help, in both performing the experiments and explaining the theory related to various.

ABOUT THE AUTHORS
Dr. Ruby Das, M.Sc., M.Phil., Ph.D., is a professor of Engineering Physics at Bhilai Institute of Technology and has eighteen years of teaching and research experience. She is the Chairman, Board of Studies & Research supervisor at the Chhattisgarh Swami Vivekanand Technical University, Bhilai (C.G.) in the concerned subject.

C.S. Robinson, M.Sc., B.Ed., PGDCA, is a Selection Grade Lecturer having seventeen years of teaching experience in the same department and is member, Board of Studies in the same university. He has an excellent experimental approach and has developed many experimental kits in labs.

Dr. Rajesh Kumar, M.Sc., PGDCA, Ph.D., is a lecturer in the same department in the same institute. He is a Ph.D. in Engineering Physics. He has tremendous patience in developing new experiments in lab and has published research papers in national and international journals.

Prashant Kumar Sahu, Ph.D., is a postgraduate from Govt. Science College, Durg and is presently teaching at Bhilai Institute of Technology. He has been an outstanding student and teacher in the field of Physics and his areas of interest include experimental research work.

Contents

븐 Assessment of practical skills in engineering physics 1
-Benz Do's and Don’ts in Lab 2
- Benz Record of the experiments performed 3
-Benz Knowledge of basic definitions 4
-Benz Knowledge of basic measuring instruments in lab 8
-Benz How to draw graph 14
-Benz Internal evaluation chart for teachers 17

GENERAL PHYSICS LAB

1. Calibration of a voltmeter with a potentiometer 18
2. To compare the E.M.F. of two given cells by Lumsden’s method 24
3. To determine the specific resistance of the given wire using carry foster bridge 32
4. To determine the frequency of A.C. mains using sonometer 40
5. To determine the value of horizontal component of earth’s magnetic field 47
6. To determine the moment of inertia of flywheel 55
7. To determine acceleration due to gravity (g) by bar pendulum 61
8. To determine the surface tension of water by capillary rise method 69
9. To determine the surface tension of a liquid (water) by Jaeger’s method 76
10. To determine the coefficient of viscosity of a given liquid (glycerin) by Stoke’s method 83
11. To determine the coefficient of viscosity of water by Poiseuille’s method/
-To determine the coefficient of viscosity of a liquid by capillary flow method 88
12. To determine the mechanical equivalent of heat by Callender and Barne’s method 94
13. To determine the thermal conductivity of a bad conductor by Lee’s disk method 100

OPTICS LAB AND MODERN PHYSICS LAB

14. To verify Newton’s formula of focal length of combination of lenses with the help of nodal slide assembly 113
15. To determine the radius of curvature of a Planoconvex lens by Newton’s ring method/To determine the wavelength of light by Newton’s rings method 122
16. To determine fringe width of an interference pattern by bi-prism/To determine the wavelength of light by Fresnel’s bi-prism 130
17. To determine the wavelength of spectral lines of mercury lamp with the help of plane transmission grating 139
18. To determine the wavelength of LASER beam/Determination of grating element of a diffraction grating using LASER beam 149
19. To determine resolving power of telescope 154
20. To determine resolving power of grating 162
21. Determination of divergence of LASER beam 168
22. To determine the refractive index of glass using LASER beam 172
23. To determine numerical aperture (NA) of optical fiber 176
24. To determine the specific charge (e/m) of electron by Thomson’s Method 181
25. To study Hall Effect 189
26. To study the current-voltage characteristics of Photoresistor/To study the characteristics of LDR 196
27. To determine the value of Planck’s constant with the help of photocell 202
28. To study characteristic curves of given PN junction diode 208
29. To determine the Forbidden energy gap of material of PN junction diode 215
30. To study the characteristics of a Photodiode 223
31. To study the characteristics of Solar cell 228
32. To study the characteristics of NPN transistor in common emitter configuration 234
33. To study the characteristics of NPN transistor in common base configuration 242
34. To study logic gates 249

Preface to the Second Edition

Engineering, the science of measurement, is the offspring of physics which plays the primary role in each branch of engineering and is generally taught during the first two or three years of these courses in various technical universities, NITs and IITs. The facts predicted by theories are brought nearer to the truth through practicals. It is in the laboratory that physics students learn to practice the activities of scientists—asking questions, performing procedures, collecting and analyzing data, answering questions, and thinking of new questions to explore.

This book grew out of the lectures delivered in theory and practical classes by us to the students at the Bhilai Institute of Technology, Durg (Chhattisgarh). Along with the CSV Technical University practical syllabus, the book attempts to give a comprehensive account of a large number of other important experiments in engineering physics as well. The first edition of the book published in 2010 and it is indeed a matter of great satisfaction that the book has been received well by the academic community in central India. While using the book in the undergraduate laboratory course for engineering students, we felt the necessity of revising its certain portions.

In the Second Edition the following revisions have been done:

1. Several diagrams have been replaced in various chapters by blending careful presentation of fundamental concepts and methods of physics.

2. The concept of measuring least count in screw gauge is now more clear.

3. Measure of capillary tube diameter is redrawn. Corrections have been made in current-intensity characteristic graph of photoresistor and NOT gate electrical switching circuit.

4. In experiment 16 many points have been added in the procedure to make it clearer.

5. An alternative method to determine the forbidden energy gap of P-N junction diode material has been added.

The organization of the book remains the same. Any further suggestions for improvement of the its contents are most welcome.

—AUTHORS
Preface to the First Edition

The basic fundamental Physics forms the foundation of engineering and technology. Physics, and natural science (being a description of the nature around us) in general, is a reasonable enterprise based on valid experimental evidence, criticism, and rational discussion. It provides us with knowledge of the physical world, and it is an experiment that provides the evidence that grounds this knowledge. Experiment plays many roles in science. One of its important roles is to test theories and to provide the basis for scientific knowledge. Experiment can provide hints toward the structure or mathematical form of a theory and it can provide evidence for the existence of the entities involved in our theories.

This book has been written with the specific aim of presenting the subject-matter in the simplest possible manner keeping in view the difficulties and the limitations of the average students. The completely redesigned, pedagogically consistent artwork and diagrams integrate seamlessly with the text to help “more visual” learners better visualize key concepts. The difficult experiments are explained in a simple language with the help of neat diagrams. We feel that if a student does all these thoroughly, the subject will appear to be friendly and enjoyable.

It is earnestly hoped that students and teachers of physics, engineering and technology will find the book useful. The authors will appreciate any genuine and authentic suggestions, for the substantial improvement of the book. All available standard books on the subject have been freely consulted during the preparation of this book. We acknowledge gratefully our indebtedness to the authors and publishers of different books on the subject. Authors are thankful to the management of Bhilai Institute of Technology for providing all facilities in the laboratory. We thank the members of our family for their support and encouragement. Finally we are grateful to Laxmi Publications, (P) Ltd, New Delhi, for taking keen interest in the publication of this book.

—AUTHORS

(viii)
“Physics is the Father of all branches of Engineering and Technology.” The physicist discovers scientific principles and invents devices to describe and explain them. The technician applies and magnifies these devices for human convenience and comfort. There is no branch of engineering or technology in which one or other physical principle is not applied on a scale never contemplated by the discoverer. Knowledge of Physics is so interwoven with engineering studies that one cannot think of pursuing engineering studies without the knowledge of Physics. Study of Physics is essential for students and practitioners of engineering and technology to develop them in proper understanding of physical phenomenon, scientific temper and engineering aptitude. Thus, it becomes immensely important to develop zeal among the students by creating an innovative ideas and thoughts. Obviously the laboratories are the best corners for inculcating such habits.

The authors have judiciously opted to jot down their ideas and work in the form of a textbook on Practical Physics which is of utmost importance to students. Such type of book was under very much demand and I am of strong belief that the demand can be fulfilled by the present book. Moreover, this book will definitely reduce the gap between the theoretical aspects of Physics and its practical counterpart which is the need of the day. In short, the book is an indispensable reference to faculty members and laboratory instructors and an invaluable aid to students.

I am pleased and honoured to have been asked to write the foreword for this book. The authors should be congratulated for providing this valuable reference book for the would be technocrats.

ENGINEERING PHYSICS LABORATORY

DO’S

1. Obtain copy of the syllabus of your Engineering Physics lab.
2. Always be regular in practical classes and complete your work within the given schedule. In all twelve turns (two periods, total of 90 minutes per turn = 24 periods) shall be scheduled in the whole semester and there are ten experiments to be performed from different branches of Engineering Physics.
3. Write down the experiments in your practical file in the same manner as given in this book.
4. Handle all the instruments carefully. Students found involved in any kind of misplacement or breakage of lab instruments may be liable to fines.
5. Bring calculator, graph paper (if required) and the observation copy regularly in your lab periods. At the end of the period submission of observation copy is a must for getting attendance.
6. Concentrate on each line written in this book, go through the experimental set-ups and fill all the observation tables mentioned. Show calculations in the given manner. Prepare answers of viva-voce.
7. Display a disciplined behavior. This should reflect in your manners and even in your talks. For any quest regarding the Engineering Physics practical, discuss with Teacher in-charges.
8. The award of sessional marks in the examinations is largely dependent on the attendance in the theory and practical classes as well as in internal marks obtained by your performance in the lab, which is entered by the teachers in the enclosed internal invaluation chart for teacher incharges. So, batch-wise get your readings checked by the teacher before leaving the lab.

DON’TS

1. Do not enter the lab without your observation copy in which your name, batch number and turn number is mentioned.
2. Do not try to manipulate your readings for getting errorless results. Instead of that learn how to perform the experiments and discuss your results with the Teacher in-charges.
3. Do not avoid the mentioned precautions to be measured in performing each experiment.
4. Do not request for your choice in performing experiment at the time of practical examination. Anyone experiment shall be asked.
